The entry in the data dictionary should specify which subsystem the database belongs to, as shown in http://www.tonymarston.co.uk/php-mysql/menuguide/dict_databa se(upd).html

This entry, in turn, points to the directory (folder) name which is used to hold all the files for that subsystem, as shown in http://www.tonymarston.co.uk/php-mysql/menuguide/mnu_subsyst em(upd).html

What are the values in your setup?
