Subject: List2 with multiple parent relations to the same table

I have a table for organizations, and a table for vehicles. There are 3 links from the vehicle table to the organization table:

vehicle.manuf_organization_id ==> organization.organization_id
vehicle.owner_organization_id ==> organization.organization_id
vehicle.operator_organization_id ==> organization.organization_id

I am trying to set up a vehicle(list2) navigation button from my organization(list1) screen, so that the owner_organization_id is taken from the organization_id of the selected organization record. The controller for the vehicle(list2) is using the aliased organization table:
$outer_table = 'owner_organization';
The organization details are correctly displayed at the top of the list2 page.

However, executing an add2 from this list2 transaction produces a "No parent has been selected yet."

I assume I need to do something to the controller file for either the vehicle(list2) or organization(list1) to make the translation between organization_id and owner_organization_id work. But what is it?
