I found the error (at least for my web environment).

I uncommented the following lines (7591-7593) in the file /includes/tcpdf/tcpdf_php5.php.

// Send PDF to the standard output
// if (ob_get_contents()) {
// $this->Error('Some data has already been output, can\'t send PDF file');
// }

With var_dump(ob_get_contents()); I got different values when I opened one of your reports e.g. for database tables (string(0) "") and one of my generated reports (string(3) "").

I think you will know where these different values come from and maybe change the code. For me it works fine with this lines commenting out.
