You say that the code in `_cm_getInitialData()` is overwriting the value for `seq_no` after returning from a popup when it should not. What you want is a piece of code whiuc says the equivalent of "If I have just returned from a popup then do not execute this code". This means that in `_cm_popupReturn()` you need to set a class variable and in `_cm_getInitialData()` you need to test this variable.
