I recently switched to the `filter_var()` function to validate all numeric input, and it seemed to be working until I tried this very same task. It seems that this function does not like leading zeroes such as '001', although it will accept a single zero '0'. Apparently this is **NOT** a bug!!!

I have therefore had to modify my validation class (update attached) to strip any leading zeroes before passing the value to the `filter_var()` function.
