Noticed that starting from v1.95, mnu\_user.dict.inc file shows:

```
$fieldspec['user_name']      = array('type' => 'string',  
                                     'size' => 30);
```

```
$fieldspec['user_password']  = array('type' => 'string',  
                                     'size' => 16,  
                                     'password' => 'y',  
                                     'nosearch' => 'y',  
                                     'noaudit' => 'y');
```

Up till version v1.94 these used to be required fields. The database schema too showed that these should be required fields.

So, the first bug: Application crash whenever new user added without populating these fields, because the 'required' validation rule did not kick in.

Then, when tried to re-import MNU\_USER table's columns in DICT module of v1.97 in the hope of correcting menu\_user.dict.inc file, the column import function did not make 'user\_name' and 'user\_password' fields 'required'. So, that is the second problem: Columns import does not work for table MNU\_USER.

Not sure these are related or not.
