I can handle it now. Thank you.

But \$filename = basename(\$filepath) returns only the name of the picture without the 'picker_subdir'. I do now extend \$filename with the value of 'picker_subdir' (pictures/training_uebungen/) manually hardcoded. Even storing the value of 'picker_subdir' in \$GLOBALS['picker_subdir'] = 'pictures/training_uebungen' doesn't work. When retrieving it in _cm_popUpReturn() it is empty.

Is there a possibility to get the value of 'picker_subdir'?
