In line 1745 of std.pdf.class.inc there is the code: \$after2 =
\$dbobject->_cm_ListView_print_after(\$current_row, \$next_row);

In my custom method _cm_ListView_print_after() is \$current_row an array with the values of the last record. \$next_row isn't an array. It is a boolean variable with value false.

Do I have to change \$next_row in _cm_ListView_print_after()? And if yes, how can I do this?
Because the return value is \$output.
