Now I see the problem. At line 262 in 'std.multi2.inc' you should see the following code:

```
// only read INNER if OUTER is not empty
if (count($outer_data) > 0) {
    if (!empty($return_from) AND !empty($return_action)) {
        ....
    } else {
        ....
    }
}
```

This should be changed to the following:

```
// only read INNER if OUTER is not empty
if (count($outer_data) > 0) {
    if (!empty($return_from) AND !empty($popup_object)) {
        ....
    } else {
        ....
    }
}
```

This fix has already been incorporated into the next release.
