Hi Tony,

Yes, I looked through what you mentioned, but have a few questions.

You say to use the `_cm_changeConfig` function. What would be needed to list the other table(destination) as a drop down within the table(sources). What I have so far is:

```
$this->fieldspec['table_id_snr']['control']    = 'popup';  
$this->fieldspec['table_id_snr']['task_id']    = 'destination(popup)snr';  
$this->fieldspec['table_id_snr']['foreign_field'] = 'table_id_snr'; <===== should this be the field ID  
from the destination table?  
unset($this->fieldspec['table_id_snr']['noedit']);  
return $fieldarray;
```

Is that what you were referring to?

Then, how would I access that data within the call to `update4`? You mention `_cm_getPkeyNames`, but how would that work, when the current value of the destination key field in the files table is NULL?

I looked for example in some of the other code, but not sure if I have the correct idea here.

Thanks,

Dan
