don't blame me for this

but i have been struggling a bit to have radicare work in a user directory under linux (/home/<myself>/public_html/radicore) because of line 633 in include.xml.php5.inc of sample radicare app (<http://www.tonymarston.net/sample/sample-application.zip>) which uses `$SERVER['DOCUMENT_ROOT']` to build a part of a path; this made some paths start with `"/var/www/"` instead of the correct one so i changed the whole line from

```
$filename = $_SERVER['DOCUMENT_ROOT'].dirname($_SERVER['PHP_SELF']).'/xsl/'
.$xsl_file;
```

to

```
$filename = dirname($_SERVER['SCRIPT_FILENAME']).'/xsl/' . $xsl_file;
```

and now it works

ps: i found a similar problem in a post about installation issues in which a solution is proposed to use rewrite rules in htaccess in order to have radicare work in "unusual" paths and i wonder (and ask...) if mine is an adoptable solution too

thanks

ps2: a found a similar declaration at line 849 in "official" include.xml.php5.inc file; i guess i could make the same modification there too
