Tony

AJAX is quite popular due to its ability to minimize data transfered over the network.

It provides the ability to send only updated/edited fields on a form instead of all the details of the form back to the server.

Gone are the days of waiting for a server response.

Do you have any roadmap to support AJAX?

I do not use javascript in the framework, but I have included the ability to build it into individual applications should you so wish.

Please see http://www.tonymarston.net/php-mysql/infrastructure-faq.html #faq61 for details.
