Dear Tony
I'm executing an ADD4 transaction from the cm_preUpdateMultiple of an UPD4 transaction; when the ADD4 executes the scriptPrevious() function then it tries to execute a "header" php command to the "screen" asociated with UPD4 transaction, which doesn't exists.
I'm using Radicore v1.91

Regards!

The only limitation of using header('Location: ...') to jump to another script is that the current script must not have written any output, such as with echo, otherwise it will output an error message saying something like "headers have already been sent". Is this the message you are getting?

It is therefore perectly acceptable to use the header() function in a script which does not produce any HTML output.

Nop, what happens is that it becomes in an infinite loop.
Google Chrome says ERR_TOO_MANY_REDIRECTS.

What I did is to execute manually getInitialDataMultiple() and insertMultiple() and now is working
