My multi2 screens with new (add2) and delete (del1) do not refresh after adding or deleting an entry. In order to see the changes I must click 'reset'.
do you know what could cause this?
version 1.24, php5, mysql5

That is very strange. I have just tried a multi2 form (Maintain Menu Contents) using version 1.24 as well as the upcoming 1.25, and I cannot reproduce this problem at all. Are you sure that you have replaced all the older scripts in the INCLUDES folder?

diff -r shows all my files in the includes directory are up to date with 1.24. I did more testing and noticed that (Maintain Menu Contents) uses a popup to select new entries. My multi2's that use popups work also. This only happens when I'm not using a popup to select new entries.

What are you using to add new entries?

add2 is used to create new entries. This is the default value for the "Child forms" when creating a multi2 script with "generate php scripts (b)"

I cannot reproduce this fault. Whenever I leave a Multi2 form by pressing a navigation button that form will *always* refresh its data from the database when it regains control irrespective of what happens in the child form.

The only time that the form will not refresh itself is if a popup button is pressed in the data area. Note that although both navigation buttons and popup buttons activate another form, their purpose is different, and returning from a popup does not cause a refresh.

Ok, I'm stepping through with a debugger and can't see where the refresh will happen. Can you point me in the right direction?

After I return from the add2 screen I am stepping through the std.multi2.inc file I never get to the getData() function.

Here is some info while stepping through std.multi2.inc:

\$_POST is empty
\$_GET only contains session_name
\$return_from is set properly
\$return_action is 'OK'
\$popup_object is null
\$selection is null

does any of this help?

Now I see the problem. At line 262 in 'std.multi2.inc' you should see the following code:

```
// only read INNER if OUTER is not empty
if (count($outer_data) > 0) {
    if (!empty($return_from) AND !empty($return_action)) {
```

```
....  
} else {  
....
```

This should be changed to the following:

```
// only read INNER if OUTER is not empty  
if (count($outer_data) > 0) {  
    if (!empty($return_from) AND !empty($popup_object)) {  
        ....  
    } else {  
        ....
```

This fix has already been incorporated into the next release.

AJM wrote on Wed, 13 June 2007 11:18Now I see the problem. At line 262 in 'std.multi2.inc' you should see the following code:

```
// only read INNER if OUTER is not empty  
if (count($outer_data) > 0) {  
    if (!empty($return_from) AND !empty($return_action)) {  
        ....  
    } else {  
        ....
```

This should be changed to the following:

```
// only read INNER if OUTER is not empty  
if (count($outer_data) > 0) {  
    if (!empty($return_from) AND !empty($popup_object)) {  
        ....  
    } else {  
        ....
```

This fix has already been incorporated into the next release.

You may have already got this but I just noticed the same problem with multi3 I made the same fix as above on line 299 in std.multi3.inc and it seems to be working fine.

Thanks for spotting that. It will be fixed in the next release.
