I'm continuing this thread, because I've got stuck on the same problem as augustin.

My ISP does allow me to have more than one MySQL (no PostgreSQL, no Oracle) database, but the name of the database and the username are determined by the ISP at the moment the database is created. For example:

Database name db212131226
User name dbo212131226

The only thing I can change is the password.

In the newly created database, I do not have the 'create user' privilege so I could create one and the same user/password in different databases. (Even my SELECT access to the data dictionary is restricted.) I would have to talk to the support staff to have privileges changed.

However if the RADICORE software requires the database names to be 'audit', 'dict' etc, then we have a serious problem, because I doubt whether the ISP will rename databases for me.

Is there a way of mapping your internal db names to external names like the above one?

Best regards
Horst Frank
