I'm afraid that Radicore was designed as a modular system, and each module uses its own database with hard-coded database names. The amount of effort required to re-engineer all that code just to satisfy the feeble requirements of amateur web hosting companies is not something I am prepared to do.

If your ISP does not allow more than one database then I can only suggest that you switch to a different ISP who is prepared to offer a more professional level of service.

I have also heard of some ISPs who refuse to load optional extensions such as XML and XSL, which makes using Radicore impossible. That is not my problem, it is an ISP problem.
