Subject: Re: getInitialDataMultiple does not deal with ') OR (' in $where parameter

I've had a play with this and changed the getInitialDataMultiple() method so that it outputs a multi-dimensional array (indexed by row number, then associative for each row) instead of an associatve array for a single row only. This will be released in version 1.30.0 which will be available shortly.

In the meantime you can try this code - in the getInitialDataMultiple() method of std.table.class.inc change this:

```
    if (!empty($where)) {
        if (is_array($where)) {
            $fieldarray = $where;
        } else {
            // convert 'where' string to an associative array
            $fieldarray = where2array($where);
        } // if
    } else {
        $fieldarray = array();
    } // if
```

to this:

```
    if (!empty($where)) {
        if (is_array($where)) {
            $fieldarray = $where;
        } else {
            // convert 'where' string to an array which is indexed by row number
            $array1 = splitWhereByRow($where);
            // convert 'where' for each row into an associative array
            foreach ($array1 as $rownum => $rowdata) {
                $fieldarray[] = where2array($rowdata);
            } // foreach
        } // if
    } else {
        $fieldarray = array();
    } // if
```

Let me know if this solves your problem.
