The reference to 'logon.xsl' in logon.php is actually redundant as it is overridden by the setting of $structure['xsl_file'] in 'logon.screen.inc'. It therefore uses file 'std.detail1.xsl' instead.

The logon.php script uses class 'logon.class.inc' which is a subclass of 'mnu_user.class.inc'. In the '_cm_getInitialData()' method of the 'logon' class you will see where it removes all the fields from $this->fieldspec EXCEPT user_id and user_password. You will therefore need to update this list of field names which are not to be removed.
