Subject: override noedit on foreign field in multi2

Hi,

is there any way to override the noedit on a foreign field in the inner rows of a multi2 - I've tried unsetting noedit in _cm_changeConfig and not seeing the foreign field in the fieldspec tried adding it to the field array? I realise its disabled for a very good reason but was hoping I would then be able to add a bit of custom code to separate the foreign field data and its primary key to update the foreign table prior to the update of the main table.

basically I'm trying to add/update many rows showing member(one) and membership (many ie each year) in a single screen. The outer table of the multi2 is the branch. With hundreds of members per branch I was hoping to be able to mimic the simplicity of our existing msaccess app which can add and amend member names and current year membership details in a single multirow screen.

Thanks

Lyndon
