OK, I see what I did. By changing "image_width" to "imagewidth", it failed to find the "/root/params/image_width", and fell back on "//root/structure/main/row/cell/@imagewidth".

So, the real reason it was not working for me before was that there is a value of 60 stored in "/root/params/image_width" and "/root/params/image_height". Where does that come from? I want to get rid of those, because they are overriding the values in my screen structure file.
