I have tried this on my system and I cannot get it to fail. When I use a CONCAT expression in a relationship the single quotes are not escaped on the screen. You can see for yourself in the demonstration system by going to Home->Dictionary->Databases, select 'Xample', press 'Tables', select 'x_person', press 'Relationships (table)' followed by 'select all' and 'Read'.

Each single quote is escaped just once when it is exported to the <table>.dict.inc file, so the resulting sql satement is perfectly valid.

I assume you are using the latest version of Radicore?
