those questions are too advanced for my current level in radicore I just wanted to modify the $where that is passed as parameter to _cm_pre_getData.

I will explain what I try to do because maybe there is another aproach:
I have a list1 of teams, from there I have a link1 transaction to team_player_xref, so I can assign players to the team.

I need to filter the players that are shown in the link1 transaction so that only the players that by age are in the category of the team are shown.

(A team has a category_id which links to a category table. The category table has this fields: category_id,date1,date2)
