Thanks for your help.

By modifying the relationship I could retrieve only one date, but in this case I need two dates from the category table, to check if the birth date is between those two.
So maybe I can modify the relationship to include date1, then in _cm_get_predata(), as I allready have the join with category I can just add the piece of code to the where clause.

Quote:you can either put code in the _cm_post_getData() method to read the 'category' table AFTER you have obtained a value for category_id from the 'team' record
Correct me if I'm wrong, but at this point I could add data, but would it be possible to remove from the read records the ones that don't meet the criteria player.birthdate between category.date1 and category.date2?
