Ok, I understand.

So now I added this code

```
function _cm_getPkeyNames ($pkey_array, $task_id, $pattern_id=null)
// perform custom processing before the selection string is passed to another form.
{
    $pkey_array[] = 'fecini';       // append to array

    return $pkey_array;

} // _cm_getPkeyNames
```

to class team but the resulting sql in teamp_player_xref still hasn't the field fecini (allthough it's selected when accessing team).
