Subject: Re: Access non key data from parent table

I've come bacjk to this topic because I coded in a quick & dirty way and want to come back and fix this now.

I've tried using the _cm_getPkeyNames() method as you suggested but without success. I actually think the method is not being called for my transaction.

I'm running a list2 transaction and am listing rows from an inner table based on a row selected from the parent table. I then have a task button for an ADD4 transaction based on the inner table (I want to add a multiple number of rows to this table).

However, in order to select correct data to use in the addmultiple I need an item of data from the previously selected parent row. I can access the primary key in $fieldarray, but the additional field I added in _cm_getPkeyNames() is not there. I've tried inserting the _cm_getPkeyNames() in the class of the child table and of the parent table. When debugging I see the code executed correctly during the building of the list2 data, but it doesn't seem to get passed to the ADD4 transaction.

I can't figure out where I am going wrong and your insight usually gets me straight to the correct solution. Here's hoping again!
