Subject: Re: Problem with _cm_filterwhere, how can do this?

In fact it does make a difference only in one screen: when the user selects more than one record for deletion:

I have a table persons and then a table part_ent_xref that links the person to the users 'entidad_id' ($entidad_id[0]['entidad_id']).

The where clause is modified so the user can only see the persons that are linked to him.

When the user selects several persons for deletion and presses the submit button, I'm not deleting the record from persons but from part_ent_xref, so if for example the original $where is:

participante_id=1 OR participante_id=4 OR participante_id=6 AND participante_id IN (SELECT participante_id FROM part_ent_xref WHERE entidad_id=7)

If I select the three persons and click on delete, and delete the record in part_ent_xref where participante_id=1, on the del1 screen the person with participante_id=1 still shows up.

I tried the where clause with parenthesis and then it doesn't show up.

(If I didn't explain myself I can give you the login details so you can check yourself)
