Ok, I looked at your example and it's not quite the same of what I need.

My xref table is transparent to the user, he doesn't know it exists. When any user creates a person I insert a record in the xref table so I know the person belongs to that user. When the user deletes the person I want to keep the record in the ddbb and I just erase the link in the xref table.

If there is no record in the xref table the user won't see that record (that's when the where clause comes to play).

All transparent to the user.

So ideally I would like that when the user selects several persons and clicks 'delete' a xref del1 transaction will appear (showing the person data), but I think that it is not possible to do this.
