Anything is possible if you think about it.

The fact that the xref table is transparent to the user is irrelevant. If you want to delete entries from the xref table then the DELETE task *must* use the xref table object. If you wish the screen to contain details from the person record then it is a simple matter to have the xref object perform a JOIN to the person table so that the necessary details can be included in the output. The user need not know that the person data was obtained indirectly via a JOIN and not directly, just that the person data is being displayed.
