In fact I added this code too to the parent class:

```
function _cm_pre_getData ($where, $where_array, $fieldarray=null){
 $this->skip_getdata = true;
 $this->fieldarray= $this->getData_raw($where);
 return $where;
}
```

and now it only displays the list2 of the first record selected in list1, allthough the .sql file has the correct where clause in the parent sql sentence.
