If you select several rows in the LIST1 task and then activate a LIST2 task then the LIST2 will show the selected rows in the OUTER area, one row at a time. The INNER area of the LIST2 will only show those rows which are related to the current row in the OUTER area.

When you say the .sql file is correct which one are you talking about? The one in the LIST1 task? The OUTER table for the LIST2 task? Or the INNER table of the LIST2 task?
