When you are using a table class it is absolutely imperative that the contents of $this->fieldspec correctly reflects the structure of the database table. The error you are seeing is because $this->fieldspec identifies a field which does not exist in the table, hence the SQL statement which is constructed will fail.

When you change the structure of any database table you *must* import the changed structure into the data dictionary, then export it to your application to rebuild the <table>.dict.inc file.

You say that this is a temporary table without any of those columns, so where did the contents of $this->fieldspec come from? If you modified $this->fieldspec to correspond with the table structure this error would not appear.
