Thanks and I'll give that a try now.

I can confirm that $selection is now available in _cm_post_search with the new files.

Regarding the return to the LIST2 and the data being filtered it's occurred to me that this is probably because I am now using a SEARCH tsk rather than an ADD task (rather than the use of append2ScriptSequence().)

I'll use scriptNext() because I prefer being able to action subsequent output tasks, but if I am correct, what would I need to do to remove any filtering on return to the LIST2?
