This version contains the following changes:

fixed bug in 'include.xml.php4/5.inc' which mis-spelled a call to getLanguageText().
modified the _sqlSelectAlternateLanguage() method inside 'std.table.class.inc' so that it allows more options.
modified 'dml.pgsql.class.inc' to include the adjustGroupBy() and adjustHaving() functions which are used for the Oracle database.
added function replaceScreenColumns() which will replace a column id in a screen structure file with a different column id (and label) at runtime. This is similar to replaceScreenHeadings() which will only replace the column label.
updated 'mnu_subsystem_s01.class.inc' (subsystem export) so that it includes the MNU_ACCOUNT and MNU_MOTD tables when exporting the MENU subsystem.
updated various 'std.*.inc' files to use $object->getErrors() instead of $object->errors.
updated Virtual Private Database processing so that users whose rdcaccount_id is greater than 1 cannot modify or delete any shared records (where rdcaccount_id = 1).
allow the selection/choice made in popup screens to be locked for the next activation.
updated 'std.output1/2/3/4.inc' so that $search is available as a 3rd argument to _cm_initialise() in case it was called from a search screen.
