Subject: Column Filter

I'd like to try and implement a column filter but not sure how it might be achieved within the framework.
I have a standard list2 screen and would like the user to be able to filter the rows displayed without having to go to a search screen, by selecting a value from a dropdown - almost like an extension to the functionality described in FAQ72 (i.e. a dropdown rather than a button).

In a perfect world this functionality might be built into the oolumn heading via a config setup (idea for an enhancement maybe?)

Is the basic function possible within the existing framework somehow?
