This version contains a few enhancements and bug fixes.

modified 'std.validation.class.inc' and 'logon.class.inc' to deal with situation where $_SESSION['rdcaccount_id'] is not present.
modified 'error.inc' to skip logoff function if $logon_user_id is 'INTERNET' or 'BATCH'.
amended XMLRPC functions to obtain the value for $GLOBALS['dbprefix'] before the database is accessed.
modified 'dml.mysqli.class.inc' so that if an errno of 2006 (MySQL server has gone away) is returned it will attempt to reconnect.
modified 'config.xmlrpc.inc.default' to change the server encoding from 'utf8' to 'iso-8895-1'. This is because the client has already changed any utf8 characters into numeric entities, and to decode them using 'utf8' again would produce the wrong results.
modified 'getLanguageFile()' within 'include.library.inc' so that if it cannot find a file beginning with 'sys' then it uses a literal error message instead of one supplied by 'getLanguageText()' as this would also fail with 'file not found'.
modified 'std.table.class.inc' so that 'getForeignData()' will not clear out any key fields if a lookup failed while within a search screen as the key may only contain a partial value.
modified 'std.table.class.inc' so that 'unFormatData()' will not insert '9999-12-31' into a field which has 'infinityisnull' set while within a search screen.
fixed bug in convertTZdate() and convertTZtime() which failed to ensure that date is converted to internal format (ccyy-mm-dd) before being converted.
