This version contains the following changes:

fixed a bug in the 'outputCSV()' method within 'std.table.class.inc' to ensure that only those fields which have been specifically selected will be output.
modified '_dml_updateSelection()' method within 'std.table.class.inc' so that it will stop on the first error.
modified 'updateRecord()' method within 'dml.*.class.inc' so that if it is called with a $where string, and the primary key has changed, it will still check for a duplicate value.
modified 'send_email()' function within 'include.library.inc' so that it puts the 'from' address into the 5th argument of PHP's mail() function to force a valid 'Return-Path' value in the mail header otherwise the sendmail program may use a value which causes the recipient's mail server to treat the email as spam. If a fixed value for Return-Path is required you can set the MAIL_RETURN_PATH constant in the CONFIG.INC file.
added option to include browser-specific CSS files. Refer to The use of Cascading Style Sheets within Radicore for details.
added option to include a QuickSearch area on LIST1 screens
upgraded TCPDF library to version 5.9.084
