If you read the tutorial carefully you will see that the text is actually obtained from a file called 'language_text.inc' and not from the database. This is part of the internationalisation feature which allows you to have different translations in different language subdirectories.

After changing the database you must run the Export Subsystem function in order to create the file named '<subsys_dir>/text/<subsys_id>.menu_export.txt'. You can then extract the relevant portions and copy them to your 'language_text.inc' file.
