This version contains the following changes:

added ability to pre-select a field name in the QuickSearch dropdown.
added option to include a QuickSearch area on LIST2 screens.
fixed bug which failed to display multiple error messages on the logon screen.
modified 'include.xml.php5.inc' to replace '
</br>' with '<br />' in HTML output to get around a bug in the libxslt library.
added 'SUBMIT+stay' and 'SUBMIT+next' buttons to LINK1 pattern.
modified XML output so that if a field's value is an array it will be output as '<array key="0" value="value1" />' instead of '<array id="value1" />' so that associative arrays can be shown properly.
added ability to specify the 'nosort' option in the $structure['<zone>']['columns'] array as well as the $structure['<zone>']['fields'] array.
as the <COL ALIGN="..."> and <COL VALIGN="..."> attributes are poorly supported in most browsers (and removed from HTML5) I have changed the code in 'include.xml.php4/5.inc' to convert them to 'class' attributes instead. The 'class' attribute within <COL> is also poorly supported, so I have changed 'std.column_hdg.xsl' and 'std.data_field.xsl' so it will now be added to every cell within that column instead. This has been tested in IE8, Firefox 5.0, Opera 11.5 and Safari 5.0.5. See Model-View-Controller for details.
modified all XSL stylesheets to include 'indent=yes' so that HTML output is easier to read.
change the handling of error messages so that errors generated within internal objects can be shown as having come from that object. See FAQ14 for details.
