I have different sets of tables in different databases for one simple reason - they are logically different and unrelated. This gives me the ability to create, load and restore each database very easily without having to specify individual lists of tables.

There is no performance loss in using multiple databases, neither is there any loss in functionality, so I do not see any benefit in changing the software. It would not be a trivial effort, and I don't see the point in expending effort for absolutely no benefit.
