This version contains the following changes:

updated 'include.library.inc' so that the 'removeDuplicateFromSelect()' function will not insert a duplicate field reference at the position of the first reference, otherwise it may result in an invalid SQL statement.
updated 'dml.pgsql.class.inc' for PostgreSQL version 9.1 where string literals containing the backslash character must now be defined using the escape string syntax (E'...') otherwise an error will be generated.
updated 'std.imap.class.inc' to get around problems when converting encoding into UTF-8.
updated 'std.validation.class.inc' so that the the validateEmail() function can deal with multiple addresses in a single field, and to deal with addresses in the format 'name <user@hostname.domain>'.
updated 'include.session.inc' to call quicksearch code from a separate function.
fixed bug in 'std.table.class.inc' which cause the deleteRecord() function to lose the contents of $this->numrows after calling validateDelete().
updated 'std.table.class.inc' so that the insertOrUpdate() function will check $this->no_display_count before generating a message.
updated std.fileupload1.inc to include a 'submitstay' button so that it does not exit after uploading a file.
fixed bug in 'dml.*.class.inc' so that the getData_serial() method uses !is_null() on $rdc_limit and $rdc_offset instead of !empty() as the value zero returns TRUE with empty().
