That's the whole problem Tony. I do not see how to import the database. The menu options that are shown in the installation instructions for database import step are not there on my installation.. In the tutorial it has two vital menu buttons on the list subsystem that I do NOT see. These are DATABASES and AUDIT TRAIL. Have I missed an SQL IMPORT file somewhere? I have repeated the installation now twice and have the same results.
Perplexed. I would love to be able to generate a system to replace my old hand-coded applications and to build additional functionality.
Thanks for your further advice.
