So Radicore only supports integer auto increment fields? Isn't that a little against your declared principals? I'm just wondering really what the best place to inject complex primary keys would be... I don't need any special functionality to do it. It's be similar to trying to keep two table's keys in sync, or any number of other very useful usages. Surely this is already possible? Radicore doesn't really seem to require keys to be in any particular format.
