Subject: Hide some screen elements?

What is the basic algorithm behind hiding some of the screen elements and bars in "list" mode?
For example, to hide "select/unselect all" and "page size" or hide action bar or message area?

As far as I understand to achieve this some xsl params should be set, as "noshow" for "page size" and "noselect" for "select/unselect all".
This params ($xsl_params) could be set while building XML (function buildXML) or as attribute of the table object ($xsl_params).

If I know in advance, that I don't want action bar or help string above the menu in list mode, what is the best place to set this parameters?

Thanks in advance!
