That's the problem with those PostgreSQL developers - they like to crow about how MySQL is a "toy database" that does not follow the SQL standards, yet they fail to provide a working implementation of it themselves. What a bunch of oiks! It's small wonder that MySQL is much more popular.

As PostgreSQL does not support REPLACE INTO you will have to use the subsystem ERASE feature to delete the current database entries before using the scripts to INSERT.

Unfortunately you will have to edit the files manually to insert each record one at a time.
