Subject: Adding line breaks to text fields

I found a workaround within the framework. There are two steps to this:

Step 1:
Add the line of code $cellspec['text'] = str_replace ("<br>", chr(10), $cellspec['text']);

in the function detailView_multi (&$dbobject, $zone, $current_row) just below the line $cellspec['text'] = str_replace(' ', $nbsp, $cellspec['text']); in the file std.pdf.class.inc

Step 2:
In the cell where one wants to introduce the line break you can introduce the string "<br>" such that for example if you want to print "hello world" but with a line break then you would have to modify the text string to "hello
world".
