Sorry for writing once again but I was too fast. I now see the shared occurences in the inner table list but not the entries of the actual account (account_id = 2).

I have a form based on a list 1 pattern and there I can see the correct entries when I log in with different users.

I checked the variables $where in the std.list2.inc and there is always the value rdcaccount=1 and not rdcaccount=1,2.

I also copied the newest includes-files from 1.84.0 and changed the database schema to 1.84.0 with no result.

Shall I delete and recreate the database tables once more?
