I repeat, the workflow system was not designed to run a series of tasks in batch mode. A workflow is supposed to have one or more manual tasks which prompt a user for action. Batch jobs which load data from CSV files do not wait for user action as they expect to read from a disk file. If you want to load person details and person address details from a batch file then I suggest you combine those into a single batch job. I would also suggest that you combine the person and person address details into a single file to avoid the problem where the job looks for a second file which isn't there.
