Subject: problem with updateRecord()

I have the following code in the _cm_post_insertRecord() function. I want to change values in a parent table after inserting an additional occurence in the child table.
But the values aren't updated with $dbobject->updateRecord ($data);

```
   function _cm_post_insertRecord ($rowdata)
   // perform custom processing before database record is inserted.
   // if anything is placed in $this->errors the insert will be terminated.
   {
      // verfÃ¼gbare (+1), belegte (+1) und freie PlÃ¤tze (-1) werden aktualisiert
      // get contents of foreign table SPIELE_TRANSPORT
$dbobject =& RDCsingleton::getInstance('spiele_transport'); // Instanz fÃ¼r Lookup-Tabelle
$where = "verbaende_art_id='{$rowdata['verbaende_art_id']}' AND
   verbaende_kuerzel='{$rowdata['verbaende_kuerzel']}' AND
   vereine_kuerzel='{$rowdata['vereine_kuerzel']}' AND
   saison_id='{$rowdata['saison_id']}' AND
   mannschaften_id='{$rowdata['mannschaften_id']}' AND
   spiel_seq_no='{$rowdata['spiel_seq_no']}' AND
   transport_no='{$rowdata['transport_no']}'";

$data = $dbobject->getData ($where);

if (!empty($data)){
    $data = $data[0];
    $data['transport_plaetze_belegt'] += 1;
    $data['transport_plaetze_frei'] -= 1;
 $dbobject->updateRecord ($data);

} // if

      return $rowdata;

  } // _cm_post_insertRecord
```

I know that in the std.tbl.class.inc the function updateRecord() comes with $fieldarray. But I don't know how to handle it.

What is wrong with my code?
Many Thanks in advance.
