If you look at the code in any of the controller scripts you should see it first checks for the $_POST array not being empty, then looks for one of the values in the $act_buttons array to determine what action to take.

In my framework those values are presented as visible buttons on the screen, but I see no reason why the same values cannot be made available by hidden fields. It is already possible for the POST action to be triggered by javascript refer to How to add javascript to your RADICORE application, so I cannot see any reason why you cannot achieve what you want.
