When you say "in Firefox the code is simply displayed" what exactly do you mean? Is the page being rendered into HTML, or is the raw XML being displayed without being transformed by the XSL file?

The resource name causing the error 'https:///radicore/xsl/std.detail1.xsl' looks incomplete to me. It should be something like HTTPS://rocket.secureguards.com/~radicore/demo/xsl/std.detai l1.xsl or even HTTPS://secure.radicore.org/demo/xsl/std.detail1.xsl. What do you have set for $GLOBALS['https_server'] and $GLOBALS['https_server_suffix'] in your CONFIG.INC file?

BTW, the URL you posted, https://secure.ivado.com/radicore/ keeps giving me "page cannot be displayed".
